# **CONDA 4.6 CHEAT SHEET**

Take a conda test drive at bit.ly/tryconda

Windows, macOS, Linux:
Same commands for all platforms.

For full documentation of any command, add --help to the command.

EXAMPLE: conda create --help

#### **Getting Started**

Verify Conda is installed, check version number	conda info
---	------------

Update Conda to the current version conda update -n base conda

Update all packages to the latest version of

Anaconda. Will install stable and compatible conda update anaconda

versions, not necessarily the very latest.

#### Working with Environments

Create a new environment named ENVNAME with	conda	create	name	ENVNAME	python=3.6

specific version of Python and packages installed. "PKG1>7.6" PKG2

Activate a named Conda environment conda activate ENVNAME

Activate a Conda environment at a particular location on disk conda activate /path/to/environment-dir

Deactivate current environment conda deactivate

List all packages and versions in the active environment conda list

List all packages and versions in a named environment conda list --name ENVNAME

List all revisions made within the active environment conda list --revisions

List all revisions made in a specified environment conda list --name ENVNAME --revisions

Restore an environment to a previous revision conda install --name ENVNAME --revision REV NUMBER

conda remove --name tdm23 env 1 --all

Delete an entire environment conda env create -file "" conda remove --name ENVNAME --all

TIP: Anaconda Navigator is a desktop graphical user interface to manage packages and environments with Conda. With Navigator you do not need to use a terminal to run Conda commands, Jupyter Notebooks, JupyterLab, Spyder, and other tools. Navigator is installed with Anaconda, and may be added with Miniconda.

## **Sharing Environments**

Make an avant convent of an anvironment

Make all exact copy of all environment	Conda	Create	CIONE	PINAINWIRE	IIaille	NEWEINV

Export an environment to a YAML file that can be conda env export --name ENVNAME > envname.yml

Create an environment from YAML file conda env create --file envname.yml

Create an environment from the file named environment, yml in the current directory conda env create

Export an environment with exact package versions for one OS conda list --explicit > pkgs.txt

Create an environment based on conda create --name NEWENV --file pkgs.txt

create an environment with a specific version of Python: conda create -n myenv python=3.7

How to update an existing Conda environment with a .yml file conda activate myenv

### Using Packages and Channels

Search for a package in currently configured channels with version range >=3.1.0, <3.2"	<pre>conda search PKGNAME=3.1 "PKGNAME [version='&gt;=3.1.0,&lt;3.2']"</pre>
Find a package on all channels using the Anaconda Client	anaconda search FUZZYNAME
Install package from a specific channel	conda install conda-forge::PKGNAME
Install a package by exact version number (3.1.4)	conda install PKGNAME==3.1.4
Install one of the listed versions (OR)	conda install "PKGNAME[version='3.1.2 3.1.4']"
Install following several constraints (AND)	conda install "PKGNAME>2.5,<3.2"
Add a channel to your Conda configuration	conda configadd channels CHANNELNAME

Additional Useful Hints	
Detailed information about package versions	conda search PKGNAMEinfo
Remove unused cached files including unused packages	conda cleanall
Remove a package from an environment	conda uninstall PKGNAMEname ENVNAME
Update all packages within an environment	conda updateallname ENVNAME
Run most commands without requiring a user prompt. Useful for scripts.	conda installyes PKG1 PKG2
Examine Conda configuration and configuration services	conda configshow conda configshow-sources
